A two-dimensional gel database of human plasma proteins

An updated two-dimensional electrophoretic map of human plasma proteins is presented, together with a complete listing of the individual protein spots, their locations, size and isoelectric points relative to internal charge standards. Forty-nine polypeptide species are identified, many consisting of multiple spots differing in glycosylation or sequence (e.g., immunoglobulins). A further series of 35 as yet uncharacterized proteins is indicated.

1 Introduction

Following the introduction of high-resolution two-dimensional (2-D) electrophoresis [1–4], the human plasma pattern was one of the first on which a significant number of proteins was identified [5]. This paper provides an updated 2-D map of human plasma, extending the previous published versions [5–10]. A complete table of spot positions, fitted sodium dodecyl sulfate (SDS) molecular masses and isoelectric points (specified relative to the creatine phosphokinase, CPK, charge standard system [11]) is provided, together with tables of identified protein spots sorted by spot number and by identification. Several additional proteins have been identified, primarily as a result of the efforts of Hochstrasser's group [12–14] on lipoproteins and associated polypeptides.

2 Materials and methods

The pattern used here is identical to that presented in [8], and the reader is referred to that publication for a complete description of the methods used in its creation. Briefly, the pattern is a composite of several silver-stained 20×25 cm ISO-DALT® [15–19] 2-D gels run at various protein loadings, using Pharmacia wide-range carrier ampholytes (still the best choice for plasma) and SDS-gradient polyacrylamide slab gels. Carbamylated rabbit muscle CPK standards (now available from Pharmacia and BDH) were made according to [11]. The positions of plasma proteins within the range covered by the CPK charge train were interpolated linearly with respect to the two adjacent CPK spots. SDS molecular mass calibration was undertaken using a curve fitted to the known proteins (Fig. 1). This is an improved calibration scale as compared to the earlier published values. The numbers of residues present in the proteins used for internal standardization were taken from the Protein Identification Resource (PIR) sequence database [20]. We selected the best-fitting simple equation using the program "Tablecurve" on a PC, and multiplied the resulting predicted values by 112 (the weighted average mass of amino acids in sequenced proteins) to give the predicted molecular masses. The best-fitting equation was given by $y = \exp(a+bx)$, where y is the number of residues, x is the gel Y coordinate, a is 7.624669 and b is -0.001887. The gel images were originally processed using the TYCHO system [21–26], and the database converted to relational form and expanded using the commercially-available Kepler® software system (Large Scale Biology Corp.). Graphical results were prepared as Postscript output from the Kepler® system and printed on an Apple laserwriter or an ultra-high-resolution Postscript-compatible Linotronic output device.

3.1 Plasma protein 2-D map

The plasma protein pattern (Fig. 2) contains many easily remembered landmarks. Master spot numbers (MSN's) associated with all spots are shown in Fig. 3 (the acidic portion of the pattern) and Fig. 4 (the basic portion). The presence of numerous glycosylation trains in the plasma pattern leads to high numerical spot density in the higher molecular weight region; to identify spots in this region we have included enlarged plots of the acidic (Fig. 5) and basic (Fig. 6) portions of this area. Finally we have included a schematic plot of the entire pattern with the densest spots filled, as an aid to cross-locating protein spots between Fig. 2 and the numbered maps.

3.2 Plasma protein tables

Table 1 lists all spots in the plasma protein database, with X and Y positions, isoelectric point relative to the CPK standards and SDS molecular weight computed according to the curve of Fig. 1. Table 2 lists the identified proteins in the pattern as spot populations, each having an abbreviated name (the POP name) and a label identifying the population more fully. Currently, 49 groups of spots are identified. Table 3 lists the spots (by master spot number) comprising each population. This table includes a series of as yet unidentified proteins (the PLS: series), some of which have been converted (through identification) to IDS: populations since the original nomenclature was devised [8]. PLS:33 is now listed as Apo-D lipoprotein, PLS:31 as Apo A-IV, PLS:29 as NA1 and PLS:30 as NA2 (D. Hochstrasser, personal communication and [12]). Table 4 presents the same data sorted by spot to enable lookup in either direction (population or spot). For details on the methods used to identify other proteins, the reader is referred to [8].

4 Conclusions

The human plasma protein map has turned out to be useful in a number of clinical and other investigations. Because of the remarkably constant appearance of the pattern in a range of different O'Farrell-type 2-D systems, it remains perhaps the best system for validating the gels themselves. Many hundreds of large-format reference plasma maps have been distributed (by ourselves and by Hoefer Scientific Instruments), and, given the existence of periodic updates such as the present paper, the plasma pattern seems destined to grow in usefulness for some time to come.

Table 2. Sets of spots identified in the plasma protein pattern, showing the abbreviated population name (POP name) and the corresponding identifying label

POP name	Label
IDS:A1-ANTICHY	Alpha1-Antichymotrypsin
IDS:A1_AT	Alpha1 Antitrypsin, MM form.
IDS:ACTIN_BETA	Platelet-derived beta actin.
IDS:ACTIN_GAMMA	Platelet-derived gamma actin.
IDS:ALBUMIN	Serum albumin, the most abundant plasma protein.
IDS:ALPHA1-B	Alpha1-B glycoprotein
IDS:ALPHA1_AP	Alpha1 AP-glycoprotein.
IDS:ALPHA2-HS	Alpha2 HS glycoprotein, a plasma protein abundant in bone, with two genetic form
IDS:ALPHA2-M	Alpha2 macroglobulin.
IDS:APO_A-I	Apo A-I lipoprotein, mature circulating form.
IDS:APO_A-II	Apo A-II lipoprotein.
IDS:APO_A-IV	Apo A-IV lipoprotein, present as two polymorphic forms. Formerly PLS:31.
IDS:APO_C-II	Apo C-II lipoprotein.
IDS:APO_C-III	Apo C-III lipoprotein, forms 1 (basic) and 2 (acidic).
IDS:APO_D	Apo D lipoprotein (previously known as PLS:33).
IDS:APO_E	Apo E lipoprotein; several charge-shift alleles exist, mainly acidic shifted.
IDS:AT-III	Antithrombin III.
IDS:C1S	Complement component C1s.
IDS:C1S_INACT	C1s inactivator.
IDS:CERULOPLAS	Ceruloplasmin: the copper transport protein in plasma, present in two forms.
IDS:FIB_ALPHA	Fibrinogen alpha chain.
IDS:FIB_BETA	Fibrinogen beta chain.
IDS:FIB_GAMMA	Fibrinogen gamma chain.
IDS:FIB_GAMMA_EXT	An extended version of the fibrinogen gamma chain.
IDS:GC-GLOB	GC-globulin, a simple polymorphic system.
IDS:HB_BETA	Hemoglobin beta chain (probably due to RBC hemolysis).
IDS:HPX	Hemopexin.
IDS:HP_ALPHA_1F	Haptoglobin alpha 1F light chain.
IDS:HP_ALPHA_1S	Haptoglobin alpha 1S light chain.
IDS:HP_ALPHA_2	Haptoglobin alpha 2 chain (allelic with alpha 1S and 1F light chains).
IDS:HP_BETA	Haptoglobin beta chain, uncleaved form.
IDS:HP_BETA_CLEAVED	A cleaved haptoglobin beta chain, missing a peptide and a glycosylation site.
IDS:IG_GAMMA	Immunoglobulin gamma chains (very heterogeneous).
IDS:IG_J_CHAIN	Immunoglobulin J-chain.
IDS:IG_LIGHT_CHAINS	Immunoglobulin light chains: lambda above and kappa below, but overlapping.
IDS:IG_MU	Immunoglobulin mu chains (very heterogeneous).
IDS:NA1	HDL-associated protein, formerly PLS:29.
IDS:NA2	HDL-associated protein, formerly PLS:30.
IDS:OROSOMUCOID	Orosomucoid, also called alpha-1 acid glycoprotein.
IDS:PLASMINOGEN_GLU	Plasminogen glu-form (terminal peptide).
IDS:PLASMINOGEN_LYS	Plasminogen, lys-form (terminal peptide).
IDS:PROTHROMBIN	Prothrombin (streaks in IEF).
IDS:PRO_APO_A-I	Pro-form of Apo A-I lipoprotein.
IDS:SRBP	Serum retinol-binding protein (sRBP). Shifts to lower MW in renal insufficiency.
IDS:TF	Transferrin, main form (with glycosylation heterogeneity).
IDS:TF_CLEAVED	Two lower MW (presumably cleaved) forms of transferrin.
IDS:TF_PRO	Higher MW form of transferrin, presumably the pro-form.
IDS:TRANSTHYRETIN	Transthyretin (TTR), formerly called prealbumin (thyroxine-binding).
IDS:ZN_A2	Zinc alpha2 glycoprotein.
